A positive integer multiset $s$ is a "Pong" if $s=\{x, x, x\}$ for some positive integer $x$.
A positive integer multiset $s$ is a "Chow" if $s=\{x, x+1, x+2\}$ for some positive integer $x$.
A positive integer multiset $s$ is an "Eyes" if $s=\{x, x\}$ for some positive integer $x$.
A positive integer sequence is a "Mahjong" if it can be divided into some (possibly zero) "Pong"s, some (possibly zero) "Chow"s, and exactly one "Eyes".
For example, sequence $s=\{1,1,4,5,1,4,4,3\}$ is a "Mahjong" because it can be divided into $\{1,1,1\}$, $\{4,5,3\},\{4,4\}$.
For each prefix of a given positive integer sequence, determine if it is a "Mahjong".

## Input

Each test contains multiple test cases. The first line contains a single interger $t\left(1 \leq t \leq 10^{5}\right)$, denoting the number of test cases.

For each test case, the only line contains an integer $n\left(1 \leq n \leq 10^{5}\right)$ and the following $n$ positive integers $a_{1}, a_{2}, \ldots, a_{n}\left(1 \leq a_{i} \leq 10^{9}\right)$, denoting the length of the integer sequence and the elements of the positive integer sequence, respectively.

It is guaranteed that the sum of $n$ over all testcases does not exceed $10^{5}$.

## Output

For each test case, print a string consisting of ' 0 ' and ' 1 ' in one line. The $i$-th character is ' 1 ' if the prefix of length $i$ is a "Mahjong"; otherwise it is ' 0 '.
