## Problem E. Easy Win

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 2 seconds |
| Memory limit: | 512 mebibytes |

Alice and Bob are playing a game.
They have $n$ piles of stones, such that there are $a_{i}\left(1 \leq a_{i} \leq n\right)$ stones in the $i$-th pile.
During his/her turn, each player, starting from Alice, will pick any pile and take at least one and at most $x$ stones from it.

The player that can't make a move on his/her turn (all piles are empty) loses.
Alice and Bob still have not decided the final value of $x$, so they have asked you to find out who will win if both players play optimally for all values of $x$, such that $1 \leq x \leq n$.

## Input

The first line of input contains one integer $n(1 \leq n \leq 500000)$ : the number of piles and the upper bound on the number of stones in piles.
The next line contains $n$ integers, $a_{1}, a_{2}, \ldots, a_{n}\left(1 \leq a_{i} \leq n\right)$ : the number of stones in piles.

## Output

Print $n$ words, where the $i$-th of them is "Alice" if Alice will win under optimal play for $i=x$, and "Bob" otherwise.

## Examples

| standard input | standard output |
| :---: | :---: |
| $\begin{array}{llllll} 6 & & & & \\ 6 & 6 & 6 & 6 \end{array}$ | Bob Bob Bob Bob Bob Bob |
| $\begin{array}{llll} 4 & & & \\ 1 & 2 & 3 & 4 \end{array}$ | Bob Alice Bob Alice |
| $\begin{array}{llllll} 5 & & & & \\ 1 & 2 & 3 & 2 & 2 \end{array}$ | Bob Alice Bob Bob Bob |

## Note

In the first example, independently on $x$, Bob may do symmetrical moves (the same move on the pile with the same number of stones), so on each turn, he definitely will have at least one available move.
