

# Not Another Path Query Problem

Input file:            **standard input**  
Output file:           **standard output**  
Time limit:            4 seconds  
Memory limit:          1024 megabytes

*What age is it that you are still solving traditional path query problems?*

After reading the paper *Distributed Exact Shortest Paths in Sublinear Time*, you have learned how to solve the distributed single-source shortest paths problem in  $\mathcal{O}(D^{1/3} \cdot (n \log n)^{2/3})$ . To give your knowledge good practice, Little Cyan Fish prepared the following practice task for you.

Little Cyan Fish has a graph consisting of  $n$  vertices and  $m$  bidirectional edges. The vertices are numbered from 1 to  $n$ . The  $i$ -th edge connects vertex  $u_i$  to vertex  $v_i$  and is assigned a weight  $w_i$ .

For any path in the graph between two vertices  $u$  and  $v$ , let's define the value of the path as the bitwise AND of the weights of all the edges in the path.

As a fan of high-value paths, Little Cyan Fish has set a constant threshold  $V$ . Little Cyan Fish loves a path if and only if its value is at least  $V$ .

Little Cyan Fish will now ask you  $q$  queries, where the  $i$ -th query can be represented as a pair of integers  $(u_i, v_i)$ . For each query, your task is to determine if there exists a path from vertex  $u_i$  to vertex  $v_i$  that Little Cyan Fish would love it.

## Input

There is only one test case in each test file.

The first line contains four integers  $n$ ,  $m$ ,  $q$  and  $V$  ( $1 \leq n \leq 10^5$ ,  $0 \leq m \leq 5 \times 10^5$ ,  $1 \leq q \leq 5 \times 10^5$ ,  $0 \leq V < 2^{60}$ ) indicating the number of vertices, the number of edges, the number of queries and the constant threshold.

For the following  $m$  lines, the  $i$ -th line contains three integers  $u_i$ ,  $v_i$  and  $w_i$  ( $1 \leq u_i, v_i \leq n$ ,  $u_i \neq v_i$ ,  $0 \leq w_i < 2^{60}$ ), indicating a bidirectional edge between vertex  $u_i$  and vertex  $v_i$  with the weight  $w_i$ . There might be multiple edges connecting the same pair of vertices.

For the following  $q$  lines, the  $i$ -th line contains two integers  $u_i$  and  $v_i$  ( $1 \leq u_i, v_i \leq n$ ,  $u_i \neq v_i$ ), indicating a query.

## Output

For each query output one line. If there exists a path whose value is at least  $V$  between vertex  $u_i$  and  $v_i$  output **Yes**, otherwise output **No**.

## Examples

standard input	standard output
9 8 4 5 1 2 8 1 3 7 2 4 1 3 4 14 2 5 9 4 5 7 5 6 6 3 7 15 1 6 2 7 7 6 1 8	Yes No Yes No
3 4 1 4 1 2 3 1 2 5 2 3 2 2 3 6 1 3	Yes

## Note

We now use  $\&$  to represent the bitwise AND operation.

The first sample test case is shown as follows.

- For the first query, a valid path is  $1 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$ , whose value is  $7 \& 14 \& 7 \& 6 = 6 \geq 5$ .
- For the third query, a valid path is  $7 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$ , whose value is  $15 \& 14 \& 7 \& 6 = 6 \geq 5$ .
- For the fourth query, as there is no path between vertex 1 and 8, the answer is No.

For the only query of the second sample test case, we can consider the path consisting of the 2-nd and the 4-th edge. Its value is  $5 \& 6 = 4 \geq 4$ .
