To celebrate the coming winter festival in Byteland, the main street, which can be regarded as the x -axis, is decorated with $n$ colorful lamps, labeled by $1,2, \ldots, n$. The x-coordinate of the $i$-th lamp is $x_{i}$, and the color of the $i$-th lamp is $c_{i}$. No two lamps share the same x-coordinate.

You will be given $q$ queries. In the $i$-th query, you will be given an integer $d_{i}\left(1 \leq d_{i} \leq 250000\right)$, and you need to find the lamp $u(1 \leq u \leq n)$ with the minimum index such that there is another lamp located at $x_{u}+d_{i}$ and the color of that lamp is different from $c_{u}$, or determine it is impossible to find such $u$. Your answer is considered correct if its absolute or relative error does not exceed 0.5.

## Input

The first line of the input contains two integers $n$ and $q(1 \leq n, q \leq 250000)$ denoting the number of lamps and the number of queries.

Each of the next $n$ lines contains two integers $x_{i}$ and $c_{i}\left(1 \leq x_{i} \leq 250000,1 \leq c_{i} \leq n\right)$ denoting the xcoordinate and the color of the $i$-th lamp. It is guaranteed that no two lamps share the same x-coordinate.

Each of the next $q$ lines contains a single integer $d_{i}\left(1 \leq d_{i} \leq 250000\right)$ denoting the $i$-th query.

## Output

For each query, print a line containing a single number: the minimum index $u$ you found. If it is impossible to find such $u$, print 0 instead.

Your answer is considered correct if its absolute or relative error does not exceed 0.5 . Note that this means you can output a non-integer as well.
Formally, let your answer be $u$, and the jury's answer be $u^{\prime}$. Your answer is accepted if and only if:

$$
\frac{\left|u-u^{\prime}\right|}{\max \left(1,\left|u^{\prime}\right|\right)} \leq 0.5
$$

## Example

|  | standard input |  |
| :--- | :--- | :--- |
| 4 | 5 | 3 |
| 3 | 1 | 2 |
| 1 | 2 | 1 |
| 5 | 1 | 2 |
| 6 | 2 | 0 |
| 1 |  |  |
| 2 |  |  |
| 3 |  |  |
| 4 |  |  |
| 5 |  |  |
