## Problem A. Manhattan

Input file: standard input
Output file: standard output
Time limit: $\quad 1$ second
Memory limit: $\quad 256$ mebibytes
In Manhattan, there are streets $x=i$ and $y=i$ for each integer $i$. It is known that both Snuke's house and Smeke's house are on streets, and the Euclidean distance between them is exactly $d$. Compute the maximal possible distance between their houses when they travel along streets.

## Input

The input contains one number $d$.

- $0<d \leq 10$
- $d$ contains exactly three digits after the decimal point.

## Output

Print the answer. The answer is considered to be correct if its absolute or relative error is at most $10^{-9}$.

## Examples

| standard input | standard output |
| :--- | :--- |
| 1.000 | 2.000000000000 |
| 2.345 | 3.316330803765 |

## Problem B. Dictionary

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 2 seconds |
| Memory limit: | 256 mebibytes |

Snuke's dictionary contains $n$ distinct words $s_{1}, \ldots, s_{n}$. Each word consists of English lowercase letters. The words are sorted lexicographically, i.e., $s_{1}<\cdots<s_{n}$. Unfortunately, you can't read some characters in his dictionary. You replaced those characters with '?'. Compute the number of ways to replace each '?' with an English lowercase letter and make a valid dictionary, modulo 1,000,000,007.

## Input

First line of the input contains one integer $n(1 \leq n \leq 50)$. Then $n$ lines follow, $i^{\prime}$ 'th of then contains word $s_{i}\left(1 \leq\left|s_{i}\right| \leq 20\right.$, each character in $s_{i}$ is an English lowercase letter or a '?').

## Output

Print the answer.

## Examples

| standard input | standard output |
| :--- | :--- |
| ?sum??mer <br> c??a??mp | 703286064 |
| 3 | 1 |
| snuje <br> ????e <br> snule |  |

## Problem C. Clique Coloring

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 1 second |
| Memory limit: | 256 mebibytes |

There is a complete graph with $m$ vertices. Initially, the edges of the graph are not colored. Snuke performed the following operation for each $i(1 \leq i \leq n)$ : Choose $a_{i}$ vertices from the graph and paint all edges that connect two of the chosen points with color $i$. It turned out that no edges were painted more than once. Compute the minimal possible value of $m$.

## Input

First line of the input contains one integer $n(1 \leq n \leq 5)$. Then $n$ lines follow, $i$-th of these lines contains one integer $a_{i}\left(2 \leq a_{i} \leq 10^{9}\right)$.

## Output

Print the minimal possible value of $m$.

## Examples

|  | standard input |
| :--- | :--- |
| 2 | 5 |
| 3 | standard output |
| 5 | 12 |
| 2 |  |
| 3 |  |
| 4 |  |
| 6 |  |

## Note

Number the vertices of the graph: $1,2,3,4,5$. For example, you can color the graph in the following way:

- Choose three vertices $1,2,3$ and color edges between them with color 1 .
- Choose three vertices $1,4,5$ and color edges between them with color 2 .

## Problem D. Dense Amidakuji

Input file:
Output file:
Time limit:
Memory limit
standard input
standard output
2 seconds
256 mebibytes

Amidakuji is a famous Japanese game. The game contains $w$ (here $w$ is even) long vertical segments and Snuke can add some short horizontal segments between them. Each horizontal segment connects two adjacent vertical segments. There are $h$ layers and each horizontal segment lies on one of the layers. Thus, there are $h(w-1)$ candidate positions for horizontal segments in total. Let $(a, b)$ be the candidate position that is $a$-th from the top and $b$-th from the left (1-based). Check the figure in the next page to see how it looks like.
First, Snuke adds horizontal segments to all positions $(a, b)$ that satisfy $a \equiv b(\bmod 2)$. Then, he removed $n$ horizontal segments at $\left(a_{1}, b_{1}\right), \ldots,\left(a_{n}, b_{n}\right)$.
The game is played as follows. First, Snuke chooses one of the vertical segments. Then, he stands on the top end of the chosen vertical segment and starts moving downward. When he reaches an endpoint of a horizontal segment, he moves to the other end of the horizontal segment, and starts moving downward again. The game finishes when he reaches the bottom end. For each $i$ (1-based), compute the final position of Snuke when he chooses the $i$-th vertical segment.

## Input

First line of the input contains three integers $h, w$ and $n\left(1 \leq h, w, n \leq 2 \cdot 10^{5}, w\right.$ is an even number $)$. Then $n$ lines follow; $i$-th of them contains two integers $a_{i}$ and $b_{i}\left(1 \leq a_{i} \leq h, 1 \leq b_{i} \leq w-1, a_{i} \equiv b_{i}(\bmod 2),\left(a_{i}, b_{i}\right)\right.$ are pairwise distinct).

## Output

Print $w$ lines. In the $i$-th line, print the final position of Snuke when he chooses the $i$-th segment.

## Examples

|  | standard input |  |
| :--- | :--- | :--- |
| 4 | 4 | 1 |
| 3 | 3 | 2 |
|  | 3 |  |
|  |  | 4 |
| 10 | 6 | standard output |
| 10 | 4 | 1 |
| 4 | 4 | 1 |
| 5 | 1 | 4 |
| 4 | 2 | 3 |
| 7 | 3 | 2 |
| 1 | 3 | 5 |
| 2 | 4 | 6 |
| 8 | 2 |  |
| 7 | 5 |  |
| 7 | 1 |  |

## Note

For example, if he initially chooses the leftmost segment in sample 1 , he crosses $(1,1),(2,2),(4,2)$ and reach the bottom end of the segment that is second from the left.

## Problem E. Cellular Automaton

Input file: standard input
Output file: standard output
Time limit: $\quad 1$ second
Memory limit: 256 mebibytes
Let $w$ be a positive integer and $p$ be a string of length $2^{2 w+1}$. $(w, p)-$ cell automaton is defined as follows:

- The cells are arranged in an infinitely long 1-dimensional line.
- Each cell can take two states: 0 and 1.
- At time 0, Snuke chooses some (finite number of) cells and set their states to 1 . He sets the states of other cells to 0 .
- Let $f(t, x)$ be the state of the cell $x$ at time $t(>0) . f(t, x)$ is determined from $f(t-1, x-w), \cdots, f(t-1, x+w)$ according to the following rule:

$$
\begin{equation*}
f(t, x)=p\left[\sum_{i=-w}^{w} 2^{w+i} f(t-1, x+i)\right] \tag{1}
\end{equation*}
$$

Snuke likes a cell automaton if the number of 1 doesn't change forever (no matter how he chooses the states at time 0 ). You are given an integer $w$ and a string $s$. Compute the lexicographically minimal $p$ such that $s \leq p$ and Snuke likes $(w, p)-$ cell automaton.

## Input

First line of the input contains one integer $w(1 \leq w \leq 3)$. Next line contains string $s\left(|s|=2^{2 w+1}\right.$, $s$ consists of ' 0 ' and ' 1 '.

## Output

Print the minimal possible $p$. If there are no such strings, print "no" instead.

## Examples

| standard input | standard output |
| :--- | :--- |
| 1 | 00011101 |
| 00011000 | no |
| 11111111 |  |

## Problem F. Directions

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 4 seconds |
| Memory limit: | 256 mebibytes |

Initially, Snuke can't move at all. There are $n$ tickets, and the price of the $i$-th ticket is $p_{i}$. If Snuke buys the $i$-th ticket, for all points $(x, y)$ and a nonnegative number $t$, he can move from $(x, y)$ to $\left(x+t a_{i}, y+t b_{i}\right)$. Snuke wants to buy tickets and he wants to be able to travel between any two points. Compute the minimal possible total price of the tickets he must buy.

## Input

First line of the input contains one integer $n\left(1 \leq n \leq 2 \cdot 10^{5}\right)$. Then $n$ lines follow; $i$ 'th of these lines contains three integers $a_{i}, b_{i}, p_{i}\left(-10^{9} \leq a_{i}, b_{i} \leq 10^{9}, 1 \leq p_{i} \leq 10^{9}\right)$.

## Output

Print the minimal possible total price of the tickets he must buy in order to be able to move between any two points. If this is impossible, print -1 instead.

## Examples

|  | standard input |  | standard output |
| :--- | :--- | :--- | :--- |
| 7 |  | 4 | 4 |
| 0 | 3 | 2 |  |
| 1 | -1 | 2 |  |
| 0 | 0 | 1 |  |
| -2 | 4 | 1 |  |
| -4 | 0 | 1 |  |
| 2 | 1 | 2 | -1 |
| 2 |  |  |  |
| 1 | 2 | 3 |  |
| 4 | 5 | 6 |  |

## Note

In the Sample 1 you can, for example, buy tickets 1, 3, 6 .

## Problem G. Snake

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 1 second |
| Memory limit: | 256 mebibytes |

Snake is a polyline with $n$ vertices (without self-intersections). Initially, the coordinates of the $i$-th vertex of Snake is ( $x_{i}, y_{i}$ ). Snake can move continuously by translation and rotation, but it can't change its shape (the lengths of the segments in the polyline and the angles between segments can't be changed). The line $y=0$ is a wall, and there is a small hole at $(0,0)$. Determine whether Snake can pass though the hole. (Initially, all points on Snake satisfy $y>0$. After the movement, all points on Snake should satisfy $y<0$.)

## Input

First line of the input contains one integer $n(2 \leq n \leq 1000)$. Then $n$ lines follow, $i$ 'th of them contains pair of integers $x_{i}$ and $y_{i}\left(0 \leq x_{i} \leq 10^{9}, 1 \leq y_{i} \leq 10^{9},\left(x_{i}, y_{i}\right) \neq\left(x_{i+1}, y_{i+1}\right)\right)$. The polyline doesn't have self-intersections. No three points are on the same line.

## Output

If Snake can pass though the hole, print "Possible". Otherwise print "Impossible".

## Examples

|  | standard input |  |
| :--- | :--- | :--- |
| 4 |  | Possible |
| 0 | 1 | standard output |
| 1 | 1 |  |
| 1 | 2 |  |
| 2 | 2 |  |
| 11 |  |  |
| 63 | 106 |  |
| 87 | 143 |  |
| 102 | 132 |  |
| 115 | 169 |  |
| 74 | 145 |  |
| 41 | 177 |  |
| 56 | 130 |  |
| 28 | 141 |  |
| 19 | 124 |  |
| 0 | 156 |  |
| 22 | 183 |  |

## Note

For the first example, solution may look in the next way:

- Move 1 to the $-y$ direction.
- Rotate 90 degrees coounter-clockwise around the point $(0,0)$.
- Move 1 to the $-y$ direction.
- Rotate 90 degrees clockwise around the point $(0,0)$.
- Move 1 to the $-y$ direction.
- Rotate 90 degrees counter-clockwise around the point $(0,0)$.
- Move 2 to the $-y$ direction.

## Problem H. Distance Sum

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 4 seconds |
| Memory limit: | 256 mebibytes |

There are $n$ cities and $n-1$ roads, and they form a tree. The cities are numbered 1 through $n$. The city 1 is the root, and for each $i$ the parent of the city $i$ is the city $p_{i}$, and the distance between $i$ and $p_{i}$ is $d_{i}$. Snuke wants to solve the following problem for each $1 \leq k \leq n$ :
Compute the minimal possible sum of the distances from a certain city to the cities $1, \ldots, k$ :

$$
\begin{equation*}
\min _{1 \leq v \leq n}\left\{\sum_{i=1}^{k} \operatorname{dist}(i, v)\right\} \tag{2}
\end{equation*}
$$

Here $\operatorname{dist}(u, v)$ denotes the distance between cities $u$ and $v$.

## Input

First line of the input contains one integer $n\left(1 \leq n \leq 2 \cdot 10^{5}\right)$. Then $n-1$ lines follow, $i$-th of them contains two integers $p_{i+1}$ and $d_{i+1}$ - parent of a city $i+1$ and the distance between $i+1$ 'th city and its parent ( $1 \leq p_{i} \leq n, 1 \leq d_{i} \leq 2 \cdot 10^{5}$, the graph represented by $p_{i}$ is a tree).

## Output

Print $n$ lines. In the $i$-th line, print the answer when $k=i$.

## Examples

| standard input | standard output |
| :---: | :---: |
| 10 | 0 |
| 41 | 3 |
| 11 | 3 |
| 31 | 4 |
| 31 | 5 |
| 51 | 7 |
| 61 | 10 |
| 61 | 13 |
| 81 | 16 |
| 41 | 19 |
| 15 | 0 |
| 13 | 3 |
| 125 | 9 |
| 52 | 13 |
| 121 | 14 |
| 75 | 21 |
| 51 | 22 |
| 61 | 29 |
| 121 | 31 |
| 111 | 37 |
| 124 | 41 |
| 11 | 41 |
| 55 | 47 |
| 104 | 56 |
| 12 | 59 |

## Problem I. Substring Pairs

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 1 second |
| Memory limit: | 256 mebibytes |

Snuke came up with an integersing pair of strings $(s, t)$, but forgot it. He remembers the following information:

- The length of $s$ is exactly $N$.
- The length of $t$ is exactly $M$.
- $t$ is a substring of $s$. (You can choose consecutive $M$ characters from $s$ that are the same as $t$.)

Compute the number of possible pairs of $\operatorname{strings}(s, t)$, modulo $10^{9}+7$. Assume that the size of the alphabet is $A$.

## Input

First line of the input consists of three integers $N, M$ and $A(1 \leq N \leq 200,1 \leq M \leq 50, M \leq N$, $1 \leq A \leq 1000$ )

## Output

Print the number of pairs of strings $(s, t)$ that satisfy the conditions above, modulo $10^{9}+7$.

## Examples

| standard input | standard output |
| :--- | :--- | :--- |
| 32200501000 | 14 |
| 200 | 678200960 |

## Problem J. Hyperrectangle

Input file:
Output file:
Time limit:
Memory limit:
standard input
standard output
2 seconds
256 mebibytes

Snuke received a $d$-dimensional hyperrectangle of $\operatorname{size} l_{1} \times \cdots \times l_{d}$ as a birthday present. Snuke placed it such that its $i$-th coordinate becomes between 0 and $l_{i}$, and ate the part of the hyperrectangle that satisfies $x_{1}+\cdots+x_{d} \leq s$. (Here $x_{i}$ denotes the $i$-th coordinate). Let $V$ be the volume of the part eaten by Snuke. We can prove that $d!V(V$ times the factorial of $d)$ is always an integer. Compute $d!V$ modulo $10^{9}+7$.

## Input

First line of the input file contains one integer $d(2 \leq d \leq 300)$. Then $d$ lines follow; $i$-th of these lines contain one integer $l_{i}\left(1 \leq l_{i} \leq 300\right)$. Last line contains one integer $s\left(0 \leq s \leq \sum l_{i}\right)$.

## Output

Print $d!V$ modulo $10^{9}+7$.

## Examples

| standard input | standard output |
| :--- | :--- |
| 2 | 15 |
| 6 |  |
| 3 |  |
| 5 | 433127538 |
| 12 |  |
