

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the **non-circular** case

- 1 Let $A_i = a_1, \dots, a_i$ be the prefix of first i values of a .

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the **non-circular** case

- ① Let $A_i = a_1, \dots, a_i$ be the prefix of first i values of a .
- ② Let s be the number of indices $1 \leq i < n$ such that A_i is a permutation of B_i .
- ③ Then the number of ways is $2^s - 1$:
 - breaking up a at any non-empty subset of these indices results in a valid separation

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the **non-circular** case

- ① Let $A_i = a_1, \dots, a_i$ be the prefix of first i values of a .
- ② Let s be the number of indices $1 \leq i < n$ such that A_i is a permutation of B_i .
- ③ Then the number of ways is $2^s - 1$:
 - breaking up a at any non-empty subset of these indices results in a valid separation
 - breaking at any other index results in an invalid separation

- ④ To find s quickly, can use a permutation-invariant hash function.
 - Assign a random hash value $h(x)$ to each array value x .
 - Define hash $h(A_i)$ of a prefix to be $\sum_{j=1}^i h(a_j)$.
 - If no hash collisions then A_i is a permutation of B_i if and only if $h(A_i) = h(B_i)$.

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the circular case

- 1 For each hash value z , let $s(z)$ be number of indices $0 \leq i < n$ such that $h(A_i) - h(B_i) = z$.

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the circular case

- 1 For each hash value z , let $s(z)$ be number of indices $0 \leq i < n$ such that $h(A_i) - h(B_i) = z$.
- 2 Then (assuming no hash collisions), the number of ways is $\sum_z 2^{s(z)} - s(z) - 1$.

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the circular case

- 1 For each hash value z , let $s(z)$ be number of indices $0 \leq i < n$ such that $h(A_i) - h(B_i) = z$.
- 2 Then (assuming no hash collisions), the number of ways is $\sum_z 2^{s(z)} - s(z) - 1$.
 - For each z , taking any subset of at least 2 of the $s(z)$ indices is a valid separation.

I — Intact Intervals

Problem

Given circular array a , how many ways can it be separated into two or more intervals such that array b can be obtained by permuting each interval separately?

Solution for the circular case

- ① For each hash value z , let $s(z)$ be number of indices $0 \leq i < n$ such that $h(A_i) - h(B_i) = z$.
- ② Then (assuming no hash collisions), the number of ways is $\sum_z 2^{s(z)} - s(z) - 1$.
 - For each z , taking any subset of at least 2 of the $s(z)$ indices is a valid separation.
 - Taking two indices with different values of $h(A_i) - h(B_i)$ gives an invalid separation.
