## Problem M Mosaic Mansion

A mosaic is a picture made from square tiles arranged in a grid, at least for today's purposes.
We would like to make a mosaic with exactly the same number of tiles of each colour. We will do this by taking an existing design and removing some of the rows from it.

Figure M.1: Illustration of a solution to Sample Input 1. The three rows annotated with white can be kept, giving 6 of each colour of tile.

What is the greatest number of rows we can keep?

## Input

- The first line of input contains the number of rows, $n(1 \leq n \leq 40)$, the number of columns, $m\left(1 \leq m \leq 10^{5}\right)$, and the number of colours, $c\left(1 \leq c \leq 10^{5}\right)$ in the mosaic respectively.
- Each of the next $n$ lines contains $m$ colours of cells $p_{1} \ldots p_{m}(1 \leq p \leq c)$.

## Output

Output the greatest number of rows that can be kept while keeping equal representation for each colour in the input, or 0 if no rows can be kept.
