## Problem A. AND Permutation

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 5 seconds |
| Memory limit: | 1024 mebibytes |

You are given a sequence of $n$ distinct nonnegative integers $a_{1}, a_{2}, \ldots, a_{n}$.
For the given sequence, it is guaranteed that for all nonnegative numbers $x$, if there is some $i$ such that $a_{i} \& x=x$, then there is a $j$ such that $a_{j}=x$. Here, \& refers to the bitwise AND operator.
Find a permutation $b_{1}, b_{2}, \ldots, b_{n}$ of $a_{1}, a_{2}, \ldots, a_{n}$ such that $b_{i} \& a_{i}=0$ for all $i$. If there are multiple solutions, find any such permutation. It is guaranteed that a solution always exists.

## Input

The first line of input contains an integer $n\left(1 \leq n<2^{18}\right)$, which is the number of integers in the permutation.

Each of the next $n$ lines contains an integer $a_{i}\left(0 \leq a_{i}<2^{60}\right)$, which is the input sequence, in order of $i$. All of the $a_{i}$ 's are guaranteed to be distinct. For all nonnegative numbers $x$, if there is some $i$ such that $a_{i} \& x=x$, then there is a $j$ such that $a_{j}=x$.

## Output

Output $n$ lines, each containing a single integer, which are the $b_{i}$ 's, in order of $i$.

## Example

|  | standard input |  |
| :--- | :--- | :--- |
| 6 | 4 | standard output |
| 0 | 6 |  |
| 1 | 0 |  |
| 4 | 2 |  |
| 5 | 5 |  |
| 2 | 1 |  |
