

Problem C. Duathlon

Time limit: 1 second
Memory limit: 1024 megabytes

The Byteburg's street network consists of n intersections linked by m two-way street segments. Recently, the Byteburg was chosen to host the upcoming duathlon championship. This competition consists of two legs: a running leg, followed by a cycling leg.

The route for the competition should be constructed in the following way. First, three distinct intersections s , c , and f should be chosen for start, change and finish stations. Then the route for the competition should be built. The route should start in s , go through c and end in f . For safety reasons, the route should visit each intersection at most once.

Before planning the route, the mayor wants to calculate the number of ways to choose intersections s , c , and f in such a way that it is possible to build the route for them. Help him to calculate this number.

Input

The first line contains integers n and m : number of intersections, and number of roads. Next m lines contain descriptions of roads ($1 \leq n \leq 10^5$, $1 \leq m \leq 2 \cdot 10^5$). Each road is described with pair of integers v_i, u_i , the indices of intersections connected by the road ($1 \leq v_i, u_i \leq n$, $v_i \neq u_i$). For each pair of intersections there is at most one road connecting them.

Output

Output the number of ways to choose intersections s , c , and f for start, change and finish stations, in such a way that it is possible to build the route for competition.

Scoring

Subtask 1 (points: 5)

$n \leq 10$, $m \leq 100$

Subtask 2 (points: 11)

$n \leq 50$, $m \leq 100$

Subtask 3 (points: 8)

$n \leq 100\,000$, there are at most two roads that ends in each intersection.

Subtask 4 (points: 10)

$n \leq 1\,000$, there are no cycles in the street network. The cycle is the sequence of k ($k \geq 3$) distinct intersections v_1, v_2, \dots, v_k , such that there is a road connecting v_i with v_{i+1} for all i from 1 to $k-1$, and there is a road connecting v_k and v_1 .

Subtask 5 (points: 13)

$n \leq 100\,000$, there are no cycles in the street network.

Subtask 6 (points: 15)

$n \leq 1\,000$, for each intersection there is at most one cycle that contains it.

Subtask 7 (points: 20)

$n \leq 100\,000$, for each intersection there is at most one cycle that contains it.

Subtask 8 (points: 8)

$n \leq 1\,000$, $m \leq 2\,000$

Subtask 9 (points: 10)

$n \leq 100\,000$, $m \leq 200\,000$

Examples

input	output
4 3 1 2 2 3 3 4	8
4 4 1 2 2 3 3 4 4 2	14

Note

In the first example there are 8 ways to choose the triple (s, c, f) : $(1, 2, 3)$, $(1, 2, 4)$, $(1, 3, 4)$, $(2, 3, 4)$, $(3, 2, 1)$, $(4, 2, 1)$, $(4, 3, 1)$, $(4, 3, 2)$.

In the second example there are 14 ways to choose the triple (s, c, f) : $(1, 2, 3)$, $(1, 2, 4)$, $(1, 3, 4)$, $(1, 4, 3)$, $(2, 3, 4)$, $(2, 4, 3)$, $(3, 2, 1)$, $(3, 2, 4)$, $(3, 4, 1)$, $(3, 4, 2)$, $(4, 2, 1)$, $(4, 2, 3)$, $(4, 3, 1)$, $(4, 3, 2)$.
