

## Problem K. Stringology

Input file: *standard input*  
 Output file: *standard output*  
 Time limit: 1 second  
 Memory limit: 512 mebibytes

For a string  $u = u_1 \dots u_n$ , Bobo denotes the prefix  $u_1 \dots u_i$  by  $\text{pre}(u, i)$ . Similarly, he denotes the suffix  $u_{n-i+1} \dots u_n$  by  $\text{suf}(u, i)$ . In particular,  $\text{pre}(u, 0)$  and  $\text{suf}(u, 0)$  are empty strings.

For two strings  $u = u_1 \dots u_n$  and  $v = v_1 \dots v_m$ , Bobo denotes the concatenation  $u_1 \dots u_n v_1 \dots v_m$  by  $u + v$ . Also,

$$\text{presuf}(u, v) = \max\{i \mid i < n \text{ and } i \leq m \text{ and } \text{pre}(u, i) = \text{suf}(v, i)\}.$$

Given two strings  $s = s_1 \dots s_n$  and  $t = t_1 \dots t_m$ , let  $f(i) = \text{presuf}(s, \text{pre}(s, i) + t)$ . Find the value of  $f(0), \dots, f(n - 1)$ .

### Input

The input consists of several test cases terminated by end-of-file. For each test case,

The first line contains a string  $s_1 \dots s_n$ .

The second line contains a string  $t_1 \dots t_m$ .

- $1 \leq n, m \leq 10^6$
- $s_i \in \{a, \dots, z\}$  for each  $1 \leq i \leq n$
- $t_i \in \{a, \dots, z\}$  for each  $1 \leq i \leq m$
- In each input, the sum of  $\max(n, m) \leq 10^6$ .

### Output

For each test case, output  $n$  integers which denote  $f(0), \dots, f(n - 1)$ .

### Examples

<i>standard input</i>	<i>standard output</i>
aaa	1 2 2
a	1 1 3 1 3
ababa	0 0
a	
ab	
cd	

### Note

For the second case,  $f(4) = \text{presuf}(s, \text{pre}(s, 4) + t) = \text{presuf}(\text{ababa}, \text{abab} + \text{a}) = \text{presuf}(\text{ababa}, \text{ababa})$ .

<i>i</i>	<i>pre(ababa, i)</i>	<i>suf(ababa, i)</i>
0	(an empty string)	(an empty string)
1	a	a
2	ab	ba
3	aba	aba
4	abab	bab

Therefore,  $f(4) = 3$ .
