

## Problem H. Halfway There

Time limit: 2 seconds  
Memory limit: 512 megabytes

Given an integer  $n$ , find the median of the list of all integers from 1 to  $n - 1$  that are coprime with  $n$ .

Recall that integers  $a$  and  $b$  are called *coprime* if their greatest common divisor is 1. The *median* of a list  $L$  is defined to be the  $\frac{|L|}{2}$ -th element of  $L$  if  $|L|$  is even, and the  $\frac{|L|+1}{2}$ -th element of  $L$  if  $|L|$  is odd. Here  $L$  is assumed to be sorted in ascending order,  $|L|$  denotes the length of  $L$ , and indices are 1-based.

### Input

Each test contains multiple test cases. The first line contains the number of test cases  $t$  ( $1 \leq t \leq 10^3$ ). Description of the test cases follows.

The only line of each test case contains a single integer  $n$  ( $2 \leq n \leq 10^{18}$ ).

### Output

For each test case, print a single integer — the median of the list of integers from 1 to  $n - 1$  that are coprime with  $n$ .

### Example

standard input	standard output
3	1
6	3
10	9
19
