You are given a simple connected undirected weighted graph $G$ with $N$ nodes and $M$ edges. Each node is numbered 1 through $N$.
A spanning tree of $G$ is a subgraph of $G$, which is a tree and connects all the vertices of $G$. The diameter of a tree is the length of the longest path among the paths between any two nodes in the tree. A minimum diameter spanning tree of $G$ is a spanning tree of $G$ that has a minimum diameter.
Write a program that finds any minimum diameter spanning tree.

## Input

The first line of the input contains two integers $N(2 \leq N \leq 500)$ and $M\left(N-1 \leq M \leq \frac{N(N-1)}{2}\right)$.
Then $M$ lines follow: The $i(1 \leq i \leq M)$-th line contains three space-separated integers $u_{i}, v_{i}$ and $l_{i}$ $\left(1 \leq u_{i}, v_{i} \leq N, 1 \leq l_{i} \leq 10^{9}\right)$; it describes a bidirectional edge connecting vertex $u_{i}$ and vertex $v_{i}$ with length $l_{i}$.
It is guaranteed that the given graph doesn't have any loops or multiple edges, and the graph is connected.

## Output

In the first line, print the diameter of the minimum diameter spanning tree of $G$.
In the next $N-1$ lines, print the description of the edges in the minimum diameter spanning tree of $G$. The $j(1 \leq j \leq N-1)$-th line should contain two space-separated integers $x_{i}$ and $y_{i}\left(1 \leq x_{i}, y_{i} \leq N\right)$; it describes a bidirectional edge connecting vertex $x_{i}$ and $y_{i}$.
If there are several possible answers, print any one of them.

## Examples

|  | standard input |  | standard output |
| :--- | :--- | :--- | :--- |
| 3 | 3 |  | 2 |
|  |  |  |  |
| 1 | 2 | 1 | 1 |
| 2 | 3 | 1 | 2 |
| 3 | 1 | 1 | 3 |
| 6 | 7 |  |  |
| 1 | 2 | 10 | 1060 |
| 2 | 3 | 20 | 3 |
| 1 | 3 | 30 | 6 |
| 3 | 4 | 1000 | 5 |
| 4 | 5 | 30 | 5 |
| 5 | 6 | 20 | 2 |
| 4 | 6 | 10 | 1 |
