## Problem E. Enclose Points

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 5 seconds |
| Memory limit: | 256 mebibytes |

There are $N$ points and $M$ segments on the $x y$-plane. Each segment connects two of these points and they don't intersect each other except at the endpoints. You are also given $Q$ points as queries. Your task is to determine for each query point whether you can make a polygon that encloses the query point using some of the given segments. Note that the polygon should not necessarily be convex.

## Input

The first line of the input contains three integers $N\left(2 \leq N \leq 10^{5}\right), M\left(1 \leq M \leq 10^{5}\right)$, and $Q$ $\left(1 \leq Q \leq 10^{5}\right)$, which represent the number of points, the number of segments, and the number of queries, respectively. Each of the following $N$ lines contains two integers $x_{i}$ and $y_{i}\left(-10^{5} \leq x_{i}, y_{i} \leq 10^{5}\right)$, the coordinates of the $i$-th point. The points are guaranteed to be distinct, that is, $\left(x_{i}, y_{i}\right) \neq\left(x_{j}, y_{j}\right)$ when $i \neq j$. Each of the following $M$ lines contains two integers $a_{i}$ and $b_{i}\left(1 \leq a_{i}<b_{i} \leq N\right)$, which indicate that the $i$-th segment connects the $a_{i}$-th point and the $b_{i}$-th point. Assume that those segments do not intersect each other except at the endpoints. Each of the following $Q$ lines contains two integers $q_{x_{i}}$ and $q_{y_{i}}\left(-10^{5} \leq q_{x_{i}}, q_{y_{i}} \leq 10^{5}\right)$, the coordinates of the $i$-th query point.
You can assume that, for any pair of query point and segment, the distance between them is at least $10^{-4}$.

## Output

The output should contain $Q$ lines. Print "Yes" on the $i$-th line if there is a polygon that contains the $i$-th query point. Otherwise print "No" on the $i$-th line.

## Examples
