## F - Differences

## Time limit: 2 s Memory limit: 256 MiB

We have a list of $N$ strings $S_{i}$. All strings have length $M$ and consist only of characters A, B, C and D. Let us define the distance between two strings $X$ and $Y$ as the number of indices $j$, where the strings have different characters $\left(X_{j} \neq Y_{j}\right)$. We know that the list of strings $S_{i}$ contains precisely one special string that has distance $K$ to all other strings. Note that there might be other pairs of strings with a distance of $K$. We are experiencing problems finding this special string, so please write a program to help us out.

## Input data

The first line contains space-separated integers $N, M$ and $K$. Strings $S_{i}$ are given in the following $N$ lines.

## Input limits

- $2 \leq N, M \leq 10^{5}$
- $1 \leq K \leq M$
- $N M \leq 2 \cdot 10^{7}$

## Output data

Output the index $i$ of the special string. Strings are numbered from 1 to $N$ as given in the input.

## Examples

## Input

5102
DCDDDCCADA
ACADDCCADA
DBADDCCBDC
DBADDCCADA
ABADDCCADC

## Input

465
