## Problem J. Junk Problem

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 2 seconds |
| Memory limit: | 1024 megabytes |

You are given a grid graph with $n$ rows and $m$ columns. Most edges are directed, which means you can walk from $(x, y)$ to $(x+1, y)$ or $(x, y+1)$. $k$ horizontal edges are bidirectional, which means you can walk from $(x, y)$ to $(x, y+1)$, and $(x, y+1)$ to $(x, y)$ too. It's guaranteed that there is no pair of bidirectional edges that share an endpoint.

You need to find $l$ vertex-disjoint simple paths, where the $i$-th is from $\left(1, a_{i}\right)$ to $\left(n, b_{i}\right)$. For a set of paths, we call a bidirectional edge bad if neither of its endpoints is visited by any of the paths in this set.
Output the number of all $l$ vertex-disjoint simple paths without any bad edges, modulo 998244353.

## Input

In the first line, $n, m, l, k(2 \leq n, m \leq 100,1 \leq l \leq 50,0 \leq k \leq 50)$.
In the second line, $a_{1}, a_{2}, \ldots, a_{l}\left(1 \leq a_{1}<a_{2}<\cdots<a_{l} \leq m\right)$.
In the third line, $b_{1}, b_{2}, \ldots, b_{l}\left(1 \leq b_{1}<b_{2}<\cdots<b_{l} \leq m\right)$.
In the following $k$ lines, $x_{i}, y_{i}\left(1 \leq x_{i} \leq n, 1 \leq y_{i}<m\right)$ each line, which denote that the edge ( $x_{i}, y_{i}$ ) to $\left(x_{i}, y_{i}+1\right)$ is bidirectional.
It's guaranteed that there is no pair of bidirectional edges that share an endpoint.

## Output

One integer - the answer.

## Examples
