## Problem H. Classical Maximization Problem

| Input file: | standard input |
| :--- | :--- |
| Output file: | standard output |
| Time limit: | 2 seconds |
| Memory limit: | 512 mebibytes |

You are given $2 n$ distinct points on a plane. Point $i$ has integer coordinates $\left(x_{i}, y_{i}\right)$.
Points $i$ and $j$ are a friendly pair if either $x_{i}=x_{j}$ or $y_{i}=y_{j}$.
Form $n$ pairs of points. Every point must belong to exactly one pair. The number of friendly pairs among your $n$ pairs must be maximized.

## Input

Each test contains multiple test cases. The first line contains the number of test cases $t\left(1 \leq t \leq 10^{4}\right)$. The description of the test cases follows.

The first line of each test case contains a single integer $n\left(1 \leq n \leq 10^{5}\right)$.
The $i$-th of the next $2 n$ lines contains two integers $x_{i}$ and $y_{i}$, denoting the coordinates of the $i$-th point $\left(-10^{9} \leq x_{i}, y_{i} \leq 10^{9}\right)$. All points are distinct.
It is guaranteed that the sum of $n$ over all test cases does not exceed $10^{5}$.

## Output

For each test case, print a non-negative integer $k$, denoting the maximum possible number of friendly pairs.
In the $i$-th of the next $n$ lines, print two integers $a_{i}$ and $b_{i}$, denoting a pair formed by points $a_{i}$ and $b_{i}$ $\left(1 \leq a_{i}, b_{i} \leq 2 n ; a_{i} \neq b_{i}\right)$.
Every integer from 1 to $2 n$ must appear among $a_{i}$ and $b_{i}$ exactly once. The number of indices $i$ such that points $a_{i}$ and $b_{i}$ are a friendly pair must be equal to $k$.

## Example

|  | standard input |  | standard output |
| :--- | :--- | :--- | :--- |
| 3 |  | 2 |  |
| 2 |  | 2 | 4 |
| 0 | 0 | 3 | 1 |
| 0 | 1 | 2 |  |
| 1 | 0 | 4 | 3 |
| 1 | 1 | 2 | 1 |
| 2 |  | 0 |  |
| 0 | 0 | 1 | 2 |
| 0 | 1 | 3 | 4 |
| 0 | 2 |  |  |
| 0 | 3 |  |  |
| 2 |  |  |  |
| 0 | 0 |  |  |
| 1 | 1 |  |  |
| 2 | 2 | 3 |  |
| 3 |  |  |  |
