## Problem D. Degree of Spanning Tree

Given an undirected connected graph with $n$ vertices and $m$ edges, your task is to find a spanning tree of the graph such that for every vertex in the spanning tree its degree is not larger than $\frac{n}{2}$.
Recall that the degree of a vertex is the number of edges it is connected to.

## Input

There are multiple test cases. The first line of the input contains an integer $T$ indicating the number of test cases. For each test case:
The first line contains two integers $n$ and $m\left(2 \leq n \leq 10^{5}, n-1 \leq m \leq 2 \times 10^{5}\right)$ indicating the number of vertices and edges in the graph.
For the following $m$ lines, the $i$-th line contains two integers $u_{i}$ and $v_{i}\left(1 \leq u_{i}, v_{i} \leq n\right)$ indicating that there is an edge connecting vertex $u_{i}$ and $v_{i}$. Please note that there might be self loops or multiple edges.
It's guaranteed that the given graph is connected. It's also guaranteed that the sum of $n$ of all test cases will not exceed $5 \times 10^{5}$, also the sum of $m$ of all test cases will not exceed $10^{6}$.

## Output

For each test case, if such spanning tree exists first output "Yes" (without quotes) in one line, then for the following $(n-1)$ lines print two integers $p_{i}$ and $q_{i}$ on the $i$-th line separated by one space, indicating that there is an edge connecting vertex $p_{i}$ and $q_{i}$ in the spanning tree. If no valid spanning tree exists just output "No" (without quotes) in one line.

## Example

|  | standard input |  | standard output |
| :--- | :--- | :--- | :--- |
| 2 |  | Yes |  |
| 6 | 9 | 1 | 2 |
| 1 | 2 | 1 | 3 |
| 1 | 3 | 1 | 4 |
| 1 | 4 | 4 | 5 |
| 2 | 3 | 4 |  |
| 2 | 4 |  |  |
| 3 | 4 | No |  |
| 4 | 5 |  |  |
| 4 | 6 |  |  |
| 4 | 6 |  |  |
| 3 | 4 |  |  |
| 1 | 3 |  |  |
| 2 | 3 |  |  |
| 3 | 3 | 2 |  |

## Note

For the first sample test case, the maximum degree among all vertices in the spanning tree is 3 (both vertex 1 and vertex 4 has a degree of 3 ). As $3 \leq \frac{6}{2}$ this is a valid answer.
For the second sample test case, it's obvious that any spanning tree will have a vertex with degree of 2 , as $2>\frac{3}{2}$ no valid answer exists.
