There is a string $s=s_{1} s_{2} \ldots s_{n}$. Let's denote the substring $s_{i} s_{i+1} \ldots s_{i+l-1}$ by pair $(i, l)$. Peter knows some facts about the string $s$ and the $i$-th fact is that substring $\left(x_{i}, l_{i}\right)$ is equal to $\operatorname{substring}\left(y_{i}, l_{i}\right)$.
Now, Peter wants to know how many strings containing lowercase English letters only satisfy all the facts. The answer may be too large, just print it modulo $10^{9}+7$.

## Input

The input contains multiple test cases. For each test case:
The first line contains two integers $n$ and $m(1 \leq n, m \leq 200000)$ - the length of the string and the number of facts.

The next $m$ lines, each contains three integers $x_{i}, y_{i}, l_{i}\left(1 \leq x_{i}, y_{i}, l_{i} \leq n, \max \left\{x_{i}, y_{i}\right\}+l_{i}-1 \leq n\right)$
The sum of values of $n$ in all test cases doesn't exceed 200000 and the sum of values of $m$ in all test cases doesn't exceed 200000.

## Output

For each test case output one integer denoting the answer. The answer must be printed modulo $10^{9}+7$.

## Examples

|  |  | standard input | standard output |  |
| :--- | :--- | :--- | :--- | :--- |
| 5 | 5 |  | 11881376 |  |
| 1 | 1 | 1 | 676 |  |
| 2 | 2 | 1 |  |  |
| 3 | 3 | 1 |  |  |
| 4 | 4 | 1 |  |  |
| 5 | 5 | 1 |  |  |
| 8 | 3 |  |  |  |
| 1 | 4 | 3 |  |  |
| 3 | 4 | 1 |  |  |
| 4 | 6 | 3 |  |  |
