## The 2023 ICPC North America Qualifier

## Problem K Very Important Edge Time limit: 3 seconds

You are given a simple connected graph where each edge is assigned a non-negative weight. Recall that a minimum spanning tree of a graph is a connected, acyclic subset of the edges of the graph with minimum total weight. Find an edge which maximizes the minimum spanning tree weight of a given graph if that edge is deleted. It is guaranteed that the input graph remains connected after deleting any one edge.

## Input

The first line of input contains two integers $n\left(3 \leq n \leq 10^{5}\right)$ and $m\left(3 \leq m \leq 10^{6}\right)$, where $n$ is the number of vertices and $m$ is the number of edges in the input graph. The vertices are numbered from 1 to $n$.

Each of the next $m$ lines contains three integers $a, b(1 \leq a<b \leq n)$ and $w\left(1 \leq w \leq 10^{6}\right)$. This denotes an edge between vertices $a$ and $b$ with weight $w$.

## Output

Output a single integer, which is the minimum spanning tree weight of the input graph after the right edge is deleted.
